

Optimize, protect, and extend your network

IT network management is a key success factor: it enhances digital performance, ensures secure access to distributed and cloud services, and enables efficient collaboration.

In a scenario where **organizations are required to manage increasingly complex network environments**, it is essential to ensure operational continuity, optimized performance, and secure, immediate, and distributed access to digital services. For this reason, organizations need **a robust and adaptable network infrastructure**, strengthened by **expert consulting** and **proactive management** of any networking technology.

Key Market Trends

25%

Network Operations Automation Rate by 2025.

50%

of network technical managers identify network security as a **priority**.

58%

of the data center market is represented by network infrastructure.

THE DISPLAYED DATA REPRESENT OUR PROCESSING OF DATA FROM MULTIPLE SOURCES.

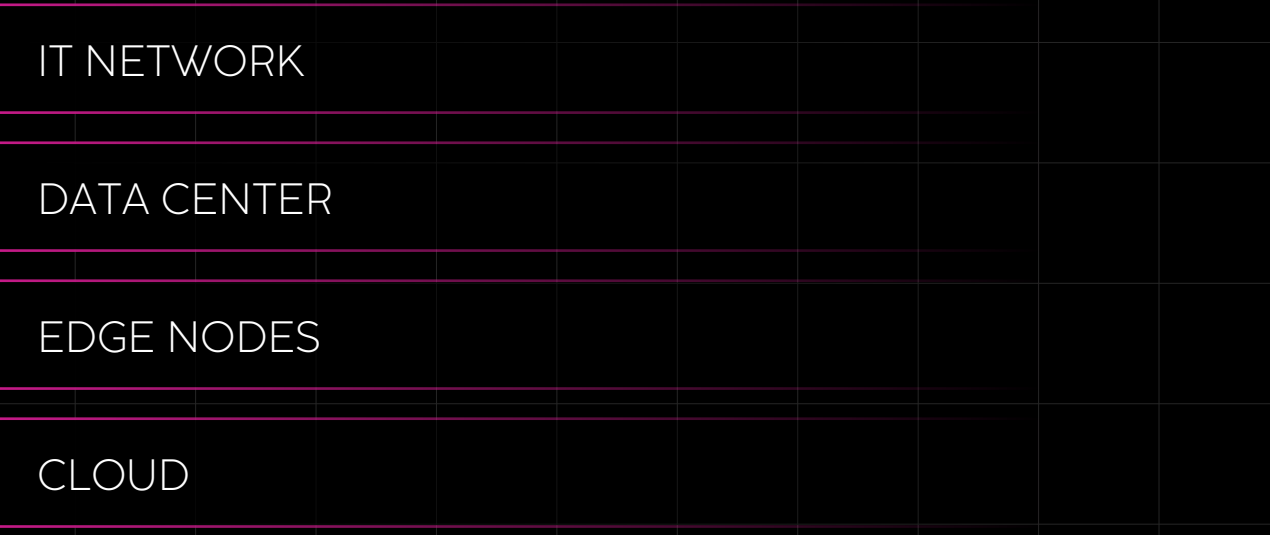

The expansion of IT infrastructures and of new network technologies requires centralized governance, advanced security, and stable performance.

→

The expansion of IT infrastructures and the adoption of new networking technologies require centralized governance, advanced security, and stable performance.

How to

Organizations can **flexibly scale** the networks of offices, factories, and production sites, connecting them with each other, to Data Centers, Edge nodes, or the Cloud.

This is achieved through **managed network services** that ensure optimized performance and centralized, efficient management.

Main Benefits

- ⊕ **Integrated management** of network services, connectivity, security, and IT infrastructure
- ⊕ **Stable internal systems and client services** with optimized performance
- ⊕ **Robust protection** against cyberattacks and unauthorized access
- ⊕ **Operational resilience** through network configurations that support data protection

End-to-end solutions covering all network technologies

We provide comprehensive coverage of all network technologies through an end-to-end offering that includes technical consulting, network architecture implementation, and integrated, centralized management of both networks and security

Network Design, Planning & Governance

Technology consulting for network architecture design and segmentation, technical project management for implementation plans, and NOC support with shared or dedicated resources for clients and third parties.

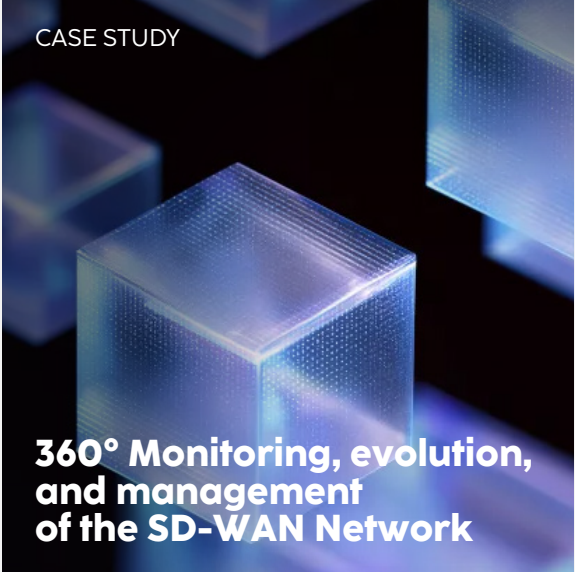

Network & Security Implementation

Ability to deploy any network architecture (single-region or multi-region) or mesh across all deployment models (cloud, on-premises, and hybrid), with specialized expertise in SD-WAN technologies.

Network Optimization & Management

Comprehensive network asset observability and a Network Operations Center for proactive incident management using AIOps tools, combined with advanced security through integration with our SOC.

Our Toolbox

Our Approach

We offer **scalable, integrated, and centralized management of network and IT infrastructures**, ensuring operational efficiency and advanced network security through the integration of our NOC and SOC.

Thanks to strategic and long-standing partnerships, we adopt **best-of-breed networking solutions** to effectively support our clients' technological evolution.
