

Digital Ecosystems

Digital Citizenship

Welfare, employment, health and safety. An ecosystem that covers all aspects of our lives, exploiting the transversal power of data to create services with which to improve our way of living and working.

Digital Transformation in Healthcare, Public Administration and Welfare must be complete, specialistic and able to integrate with the other digital ecosystems that operate in the community. It will be possible in this way to expand the value of the data, which will guide the actions and strategies increasingly focused on the citizen.

Dario Buttitta

General Director Public Administration & Healthcare, Engineering

It is necessary to offer a citizen experience that enables the person to be aware of the attention paid to their daily needs. This is implemented by increasing the quality of public services thanks to the use of digital technologies and efficient management processes. A satisfied citizen trusts institutions and contributes to the improvement of the quality of life of towns and cities through their virtuous behaviour.

Stefano De Capitani

President of Municipia, Engineering Group
